About fund performance

Investors should always consider performance in relation to the objective of the fund and over periods of at least five years. If a fund has risen in value, it doesn't mean it is meeting its objective – especially if the fund is aiming to outperform a particular benchmark or meet a risk target. The same applies if the fund has fallen in value.

Our risk rating

Below-average risk

Below average risk funds will generally see some change in day-to-day value, both positive and negative, and these changes will typically be larger than those of a cash deposit. They may hold a broad range of investment types, including equities (shares), but a significant proportion may also be invested in investments that aim to provide a reliable source of income (like government and corporate bonds) and, with that, greater stability than would typically be available from equities. They try to provide better long-term growth prospects than a cash deposit, but are lower risk than funds investing largely in equities.

Fund objective

To achieve a long-term combination of capital growth and income, targeting a return of cash (LIBOR 1 Month) + 4.5% per annum (before fees) over a rolling five year period. There is no guarantee that the portfolio will achieve a positive return over any time period and any capital invested is at risk.

Fund performance

The following graph and tables show the performance of the fund over various time periods compared to the fund's benchmark (if there is one). All performance information is as at 30 Sep 2019 unless otherwise stated.

In the graph, performance is shown since launch if the fund is less than five years old.

Source: FE fundinfo. The performance information has been calculated in pounds on a bid-to-bid basis and is net of charges with gross income reinvested. Performance for periods over a year is annualised (% per year). Past performance is not a guide to future performance. The value of an investment can fall as well as rise and is not guaranteed. Investors could get back less than they originally invested.

Risks specific to this fund

There is no guarantee the fund will meet its objective. The value of an investment can fall as well as rise and investors could get back less than they originally invested. All funds carry a level of risk and the information below outlines the key risks for this fund.

Currency risk - this fund invests overseas so its value will go up and down in line with changes in currency exchange rates. This could be good for the fund or bad, particularly if exchange rates are volatile.

Third party risk - in the event that the underlying investments which the fund invests in suspend trading, Aegon may defer trading and/or payment to investors. The value ultimately payable will depend on the amount Aegon receives or expects to receive from the underlying investments.

Credit risk - this fund invests in bonds or other types of debt. Bonds are essentially loans to companies, governments or local authorities so there's a risk that these companies or government bodies may default on the loan. Bonds are rated in terms of quality, usually from AAA down to B and below. AAA is the highest quality and therefore the least likely to default and B or lower the most likely to default. Where we have it we show the credit quality of the loans held by this fund.

Derivative risk - this fund will use derivatives in a number of ways to achieve its objectives. Holdings may add up to over 100% because derivatives offer a way to gain exposure to the returns of a specified equity or bond market without having to directly own it. These negative figures are not shown within the top holdings section. Derivatives allow a manager to buy or sell an investment at a specified future date for a specified price. However, this means the fund could be exposed to additional risks if the market moves up when the manager expected it to go down or vice versa.

Interest rate risk - interest rate changes could affect the value of bond investments. Where long term interest rates rise, the value of bonds is likely to fall, and vice versa.
